

A giant UFO spotted over Mount Fuji, Japan

On March 10, 2019, a **very huge UFO** is appeared over Mount Fuji volcano, in Japan. What is it?

The ufologist Scott C. Waring explains:

“Wow, its not often you see a UFO of this size. This is about three to four miles across! Its huge. This awesome UFO was caught over Mount Fuji two days ago. The UFO has actually left a cloud trail behind it moving from the horizon, then zig zagging its way to the Mountain. This UFO is creating and controlling the smoke around it so that it appears like a cloud. However the the UFO outline is becoming very apparent here giving away its hiding place.

It has long been believed by me that most aliens that created bases on Earth did so under the floors of the ocean and under volcanos. Why? Because those are the two places that humans are least likely to bother or even discover them. The less humans, the less chance of being discovered.

Awesome video of a large UFO near Mount Fuji. I only wish that the 51 seconds of footage was a bit longer so that we could see how the UFO left the area. Absolute evidence here that aliens do in fact visit volcanos.

Also when i refer to "we" i am speaking of myself and one other gentleman that shall remain unnamed at this time.”
