

Huge UFO caught near Popocateptl volcano in January 2021

On January 21, 2021, a webcam captured an **unidentified flying object** that entered the interior of Popocateptl, an active volcano located 70 km southeast of Mexico City.

This UFO is gigantic in size. He is seen heading towards the crater before entering it. It was ufologist Scott C. Waring who spotted this mysterious object:

“While watching the live cam for volcano Popocatepetl, I noticed this strange disk like object entering the mouth of the volcano. The object actually overlaps (half way covers) the volcano cloud...which is all the proof needed to confirm this object did enter the mouth of the volcano. You see if it went behind the clouds, it would mean its a plane. However I quickly rolled this out because this object is huge, and a plane would stay at least 5 km away from an active volcano...so if this was a plane, it would be close to 150 meters across! Thats impossible, and the fact that the volcano is erupting right at this moment prevents planes from flying over or near it.”

UFO sightings near this volcano are very common. For this ufologist, there is an explanation: this volcano is home to a secret alien base! He explains:

“Its absolutely mind boggling to see this UFO 30% in front of the clouds from the mouth of the volcano. This is 100% proof that an alien base is 5-7km below this volcano and has been there for thousands of years.”
