

# Huge UFO caught during STS-61-C mission in 1986

By watching some old pictures on NASA's website, a famous ufologist found a huge **triangular-shaped UFO**. The photo was caught in 1986 during the STS-61-C mission.

Scott C. Waring explains:

*"Guys, this is something very big in Earth's orbit. This Triangle UFO is seen in an old NASA index photo. The photo is from the STS61C mission. STS-61-C was the 24th mission of NASA's Space Shuttle program, and the seventh mission of Space Shuttle Columbia. It was the first time that Columbia, the first space-rated Space Shuttle orbiter to be constructed, had flown since STS-9. The mission happened in Jan 12 until 18th, 1986. There were seven crew members on that space shuttle...someone must have seen this!"*

*"If you look at the thickness of the triangle UFO, you see it's really huge. The object has no wings, no solar panels, no visible propulsion whatsoever! And yet...it's in Earth's orbit. This is 100% proof that aliens have been watching the NASA missions up close and personal since the very beginning."*
