

Huge UFO filmed over Mount Fuji

On November 11, 2021, a camera installed near Mount Fuji, Japan, filmed a **huge luminous UFO** flying over this famous volcano.

Scott C. Waring, famous ufologist, made this sensational discovery. He explains on his blog:

“This UFO was caught on live cam appearing suddenly out of thin air. Clearly it uncloaked slowly trying to appear as a cloud, but there is nothing cloud like about this at all. The UFO has six sides and a glowing square bottom area. The glowing square may be a window area, or it could be the propulsion system. Its not unusual to see UFOs around volcanos. I have been recording them on live cams for over two decades. Its nice to see others finally using the same tools. Live cams allow a UFO researcher to be everywhere at once. This way you can explore dozens of volcanos daily to see if you can catch something. Thousands of years ago, aliens decided to make bases in inaccessible locations to keep humans from stumbling upon them.

This UFO is nearly half a mile across! Absolutely fantastic catch! Is undeniable proof that aliens are already here.”
