

A black cubic UFO photographed near the sun

A **huge and mysterious black cube** has been discovered near our sun. This UFO has been photographed several times by NASA. What is it about?

This mysterious craft was photographed on December 18, 2021 by SoHO, a space solar observatory placed in orbit around the sun and launched on December 2, 1995.

Ufologist Scott C. Waring explains on his blog:

“Today I was looking over photos from NASA sun images when I noticed a dark cube. The cube has been seen many times over the years and I do think this is an alien ship in the shape of a cube. The craft is big, larger than earth itself. It is frequently seen around the sun and then leaves. It looks like the cube is sucking up rare solar material only found around a sun itself. The energy particles it collects are probably used to run and create alien technology. There are many undiscovered particles in the universe that humanity has yet to discover. One day, we may have to compete with these aliens for mining our sun for the rare particles. I wonder...how thats going to effect human/alien relations in the future?”
