

A huge triangular UFO discovered on the Moon?

On January 25, 2022, a **huge triangular-shaped alien craft** was discovered on the Moon. What is it about ?

The ufologist Scott C. Waring explains:

“I found a monolith in an old NASA photo. This is from the Lunar Orbiter 1 mission frame 1038. Its from August of 1966, unmanned mission. The monolith sits at an angle and is pointed at an angle...which may mean its a triangle craft that was crashed landed on the surface of the moon. It's been intelligently made, therefore it has a purpose...most likely a structure or ship...or both. The object is huge, about .5km long.”
