

An alien face discovered in space!

On January 28, 2022, a huge **alien face** was discovered in the Rho Ophiuchi cloud in the constellation of Ophiuchus.

Scott C. Waring explains:

“This face was found by me today when I was looking at some recent astronomy photos taken by astronomer Edar Ivan. Sometimes the most amazing discoveries are left undiscovered...right in front of our own noses. This photo unknowingly contains a giant alien face in the nebula. To see it on its website, go there, pull the photo off and onto your desktop, then rotate the photo right two times...because the face is upside. Now...can you see it? You know an alien species has hit the top of evolution when they have the power to manipulate and shape entire nebulas!”

The face is of an extraordinarily ancient species, 8-14 billion years old, because only an ancient species has the ability to manipulate a nebula this way. Since astronomers say the universe is 14.5 billion years old...we have a max age to work with. And since Earth is 4.5 billion, we know humans are not nearly capable of such things. So we have a below minimum age...Thus my estimate of a species that started living on a planet 8-14 billion years ago.”
