

Strange Spatial Cube Detected Near the Sun by UFOlogist

A **mysterious UFO** was reported by UFOlogist Scott C. Waring on March 28, 2022. An image captured by NASA's Solar and Heliospheric Observatory (SOHO) reveals the presence of an unusual cube near the Sun. The details observed in this object have left the scientific community and UFO enthusiasts baffled.

Scott C. Waring was the first to spot this enigmatic cube in an image from NASA's SOHO solar telescope. He claims that this cube is unlike anything he has seen before. The uniqueness lies in the extremely high level of detail within the object. Inside the cube, one can discern numerous bars, edges, and cross pieces, unlike anything previously recorded. The ufologist dismisses the notion that it might be mere pixelization in the image, as in that case, other pixels would also be affected, which is not the case here. This cube appears to be a real, solid object located near our Sun.

An intriguing characteristic of this space object is that the bottom part appears less focused and more blurry, while the upper part is sharp. According to Scott C. Waring, this contradicts any explanation related to pixelization, as pixelization effects would be uniform across the entire image. For him, there is no doubt; we are dealing with a genuine UFO the size of the moon or possibly even larger.
