

NASA filmed a spherical UFO in June 2022

On June 11, 2022, Scott C. Waring, a well-known UFO researcher, shared an intriguing observation he made while monitoring NASA's live cameras, which often provide a view of space from the International Space Station (ISS). In his post, Waring describes a mysterious object he captured on camera, which has sparked considerable interest in the UFO community.

Waring reports that he spotted an object that appeared to be a "sphere" surrounded by a blur. He notes that this kind of blur is commonly associated with unidentified flying objects (UFOs) when they are captured on camera. According to Waring, this blur may be caused by some form of energy or technology that UFOs emit, which interferes with camera focus, making their images appear indistinct.

Initially, Waring considered the possibility that the object might be a SpaceX Dragon capsule. These capsules are frequently used to transport astronauts and supplies to and from the ISS. However, Waring quickly dismissed this idea, explaining that a Dragon capsule should appear clear and well-defined in such footage, not blurry like the object he observed. Additionally, he pointed out that there were no reports of a Dragon capsule docking or maneuvering at that time, which further cast doubt on this explanation.

What makes this observation particularly intriguing to Waring is the lack of a straightforward explanation. He mentions that the object might still be visible on NASA's live cameras, although he was unable to confirm this at the time of his post. The combination of the object's spherical shape, the surrounding blur, and the absence of any known spacecraft in the area leads Waring to consider this sighting as "really odd" and possibly another example of a UFO.

This sighting fits into a broader pattern of reports that Waring frequently shares, where he documents space anomalies that he often links to extraterrestrial presence or unidentified technology. He has built a reputation in the UFO community for highlighting such incidents and sometimes criticizing space agencies like NASA for not providing clear explanations.
