

A UFO in Earth's Orbit?

Scott C. Waring, a controversial ufologist known for his bold theories, recently published an intriguing analysis on his blog of a photograph taken during the Apollo 10 mission in May 1969. According to him, this image provides irrefutable proof of an **extraterrestrial spacecraft** orbiting Earth.

The photograph in question, referenced as AS10-35-5264 in NASA's archives, indeed shows an unidentified object in space. Waring describes this object as having a particular structure: a raised central dome, a disc-shaped front part representing 80% of the whole, and a flat rear part constituting the remaining 20%.

The ufologist claims to have determined the orientation of the supposed spacecraft by observing that the thin, rounded side is facing Earth, which he believes indicates the front of the craft. He expresses surprise that such "obvious evidence" is accessible to the public in NASA's archives, while remaining largely unknown to the world's population.

It's important to note that Scott C. Waring's claims are often met with skepticism by the scientific community. More prosaic explanations for such phenomena usually include space debris, equipment reflections, or photographic anomalies.

While fascinating, these theories should be approached with a critical mind. Scientists encourage rigorous analysis and solid evidence before drawing conclusions about the existence of extraterrestrial life or alien technology visiting our planet.
