

# An Unusual Aerial Phenomenon Observed in Queenborough

On November 26, 2025, in the early hours of the morning, a resident of Queenborough, England, reported to the National UFO Reporting Center (NUFORC) that he had witnessed an unidentified aerial phenomenon. The testimony, concise yet striking, describes the brief appearance—lasting only about three seconds—of a black triangular object with a foggy, translucent light at each corner.

According to the witness, the sighting occurred while he and his wife were sitting in their garden. She was the first to notice the object, positioned directly above them at an estimated altitude of around 200 meters. The shape was clearly defined: a perfect triangle, roughly twenty meters across, silent, and marked by hazy lights forming a faint aura at each point. The object appeared sharply against the early morning sky.

It was moving extremely fast, remaining visible only for a moment. Adding to the strangeness of the event, the witness reports that just a second after the object vanished, a “shooting star” crossed the sky. He states that he had never seen anything like it and remained unsettled throughout the day.

No photograph or video could be captured in the brief timeframe during which the object was visible. The witness expresses regret at not being able to document the sighting, which he describes as “unexplainable.”

While many such reports can eventually be attributed to atmospheric phenomena, drones, or optical illusions, the Queenborough sighting currently lacks a clear explanation. Its brevity, the precision of the shape described, and the presence of two observers give it a certain significance in the ongoing study of unidentified aerial phenomena.
