

Palmer Luckey Shares Unsettling Hypotheses on UFOs

In a recent interview, Palmer Luckey, co-founder of the U.S. defense contractor Anduril, offered a series of reflections on unidentified flying objects (UFOs), particularly the so-called “Tic Tac” objects reported by U.S. Navy pilots. Without claiming definitive answers, the technology entrepreneur outlined several hypotheses that depart from conventional explanations.

According to Luckey, some of the strange and seemingly physics-defying behavior attributed to these objects may not stem solely from their nature, but also from the limitations of human perception. He suggests that witnesses may be encountering a form of reality for which they are not yet intellectually or scientifically equipped. “I don’t know if that means they are actively cloaking themselves, or if it means they do not even exist in the way we think about physical matter,” he said.

Luckey also questioned the idea that these objects are the product of recent technological developments. “It’s unlikely they were manufactured or created within the last few years,” he argued. Instead, he proposed that they may have been created long ago, stored for extended periods, or even traveled from the distant past into the present. By contrast, the notion that they originate from the future strikes him as implausible. “Coming from the future is too hard,” he said. “The physics just doesn’t seem to work.”

These remarks carry particular weight given Luckey’s role at Anduril, a company known for developing unmanned

aerial systems and advanced defense technologies. Yet he suggested that such systems could become obsolete if the true nature of UFOs were ever understood. “If and when we figure out what’s going on with UFOs, that whole universe is going to change, and this stuff won’t be relevant,” he stated.

Among the more provocative ideas raised is the possibility of an ancient, technologically advanced human civilization capable of traveling through time. While intriguing, the concept also carries a darker implication: if such beings exist, why would they choose to leave our present behind rather than remain within it? For now, the question remains open, underscoring how much about these phenomena is still unknown.
