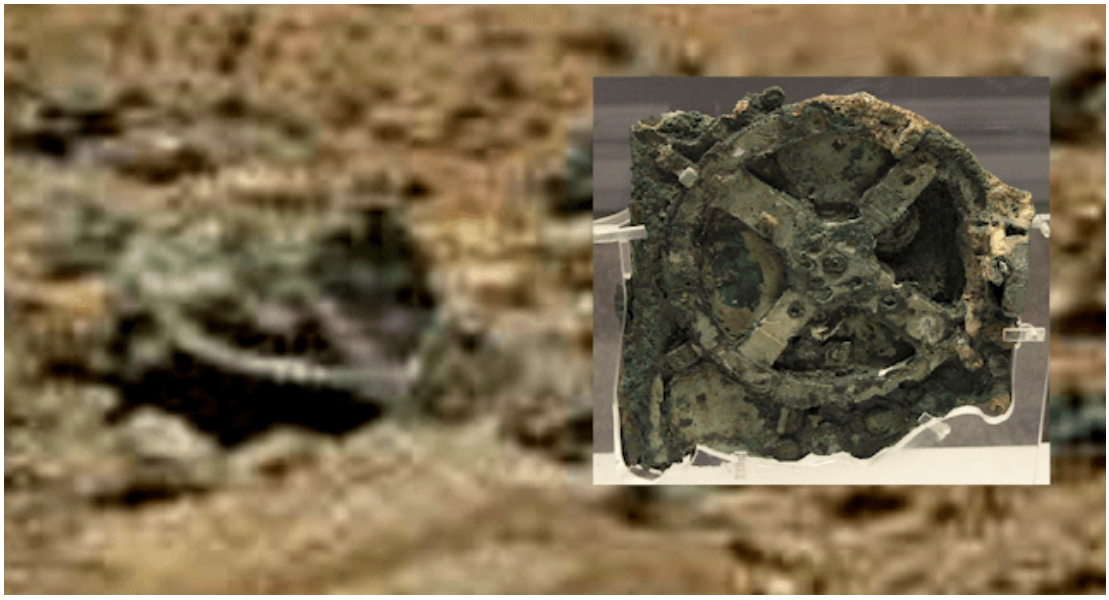
Ancient Martian Computer Discovery on the Red Planet



The ufologist Scott C. Waring has made a groundbreaking discovery on **Mars** that could potentially rewrite our understanding of the red planet's history. Waring stumbled upon an intriguing image during his exploration of NASA's Mars photo index, and the implications are nothing short of extraordinary.

Upon closer examination, Waring noticed an uncanny resemblance between the discovered object and the ancient brass computer known as the Antikythera Mechanism. The Antikythera mechanism, an ancient Greek hand-powered orrery, is hailed as the earliest analogue computer designed to predict astronomical positions and eclipses decades in advance. This unexpected find on Mars raises intriguing questions about the planet's past and the possibility of intelligent life existing there.

If the inhabitants of Mars indeed possessed similar mechanisms, it would be compelling evidence of advanced technological capabilities during the time when the Martian surface met its demise. According to NASA, Mars once harbored oceans and an atmosphere, which were subsequently obliterated by a colossal explosion from our sun.

The Antikythera-like computer discovered by Waring challenges the conventional narrative, suggesting that Mars was home to a highly evolved civilization capable of developing intricate devices for scientific and celestial observations. This find not only underscores the advanced state of Martian society but also hints at the possibility of their knowledge and achievements being lost due to catastrophic events.

While NASA's explanation posits a natural cause for the disappearance of Mars' atmosphere and oceans, the newfound artifact provides a compelling alternative hypothesis. The intricacies of the discovered mechanism imply a level of intelligence and sophistication that goes beyond mere survival, pointing to a society that was actively engaged in understanding and predicting celestial phenomena.

In light of this discovery, the question of whether Mars was once inhabited by an intelligent species becomes even more compelling. The Antikythera-like device on Mars challenges our perceptions of the planet's history and underscores the need for further exploration and investigation.
