A UFO approached the ISS in April 2022

On April 18, 2022, an **unexplained observation** was reported from the International Space Station (ISS). Scott C. Waring, a prominent researcher and author, shares his analysis of a strange celestial presence captured by NASA's live cameras.

The observed phenomenon raises questions about the nature of the space object in question. Scott C. Waring immediately rules out the possibility of it being the SpaceX capsule, emphasizing that its movement during an extravehicular activity could compromise the safety of astronauts. Furthermore, he dismisses the possibility of it being the moon, having monitored this camera for over 15 years and spotted the moon many times, asserting that the object is distinctly smaller.

Waring suggests that the space object has the characteristic shape and color of an extraterrestrial craft. A thorough observation of the recording reveals that the object maintains a cautious distance while observing astronauts during a spacewalk. This behavior implies a possible intention of observation or even assistance in case of emergencies.

The author hypothesizes that these extraterrestrial entities are not attempting to conceal themselves, yet avoiding causing fear among the astronauts. He suggests that they might be present not only to observe but also to lend a hand in critical situations. In the scenario where a spacewalk goes awry, these entities could intervene to prevent any fatal incidents before the astronaut returns to the space station.
