

The CIA Murder that Exposed MK-ULTRA

Frank Olson was a scientist working for the CIA in the 1950s, specializing in biological warfare. His death in November 1953 remains one of the greatest mysteries in U.S. history. Officially, Olson fell from the 13th floor of the Statler Hotel in New York City, in what was ruled a suicide. However, later investigations revealed disturbing details that suggest he may have been murdered.

Shortly before his death, Olson had been subjected to secret CIA experiments, including the administration of LSD without his knowledge as part of the MK-Ultra project, a program focused on mind control. These events reportedly left Olson deeply troubled, and he expressed doubts about his work, allegedly considering resignation.

Conspiracy theories abound regarding his death. Some believe the CIA eliminated him out of fear that he might expose sensitive information about covert operations. In 1994, a new autopsy revealed head injuries inconsistent with a simple fall, further fueling suspicions of foul play.

Olson's family filed a lawsuit against the U.S. government, and while they received an apology and compensation, the full truth behind Frank Olson's death remains unresolved to this day.
